A new decade, a new tool: libman

- Colby Pike (vector-of-bool)
- Reddit
- GitHub
- Specification

libman is a new level of indirection between package management and build systems.

dds is Drop-Dead Simple build and package manager.

“Making new friends” idiom by Dan Saks

Wikibooks

> *The goal is to simplify creation of friend functions for a class template.*

```
1  #include <iostream>
2  template<typename T>
3  class Foo {
4     T value;
5  public:
6     Foo(const T& t) { value = t; }
7     friend std::ostream& operator <<(std::ostream& os, const
           Foo<T>& b)
8     {
9        return os << b.value;
10    }
11 };
```

This makes me so incredibly happy! I literally just yesterday googled, C++17 / C++20 zip to see if they had anything, because I wrote some code in both C++ and #Python and Python was so much more beautiful.

```
int solve(int h, vector<int> w, vector<int> l) {
    int p = 0;
    for (int i = 0; i < w.size(); ++i)
        p = max(p, w[i] - l[i] / 4);
    return max(0, p - h);
}
```

```
def solve(h, w, l):
    p = max(a - b//4 for a, b in zip(w, l))
    return max(0, p - h)
```

Also, I just discovered std::inner_product - a beautiful temporary solution to a lack of zip. #cpp #inner_product

```
int solve(int h, vector<int> w, vector<int> l) {
    return max(0, inner_product(begin(w), end(w), begin(l), 0,
        [](auto a, auto b) { return max(a, b); },
        [](auto a, auto b) { return a - b / 4; }) - h);
}
```

STL writes:

> *`mem_fn` is less typing, but lambdas are higher performance (MSVC's optimizer can't see through `mem_fn`'s data member) and can handle overloaded/templated member functions much more easily.*

Parameter passing, by Raymond Chen, Microsoft

- If you plan on keeping the parameter anyway, then there's no need to have separate `T const&` and `T&&` overloads
- If you're not keeping the parameter, then you still want to have separate `T const&` and `T&&` overloads
