

C++ Club meeting – 25 May 2017

C++ feature polls by Bryce Lebach

Bryce Lebach @blelbach · May 19

Entirely non-serious C++-20 to C++-50 polls. Q0: Most desired [#Cpp20](#) feature.
[#CppNow](#) [#Cpp](#) [@cppnow](#)

31% Concepts

44% Modules ✓

18% Coroutines

7% Executors

188 votes • Final results

Concepts of the Upcoming Ranges TS - Eric Niebler [NWCPP]

Video

- ▶ What is in Ranges
- ▶ What is in Ranges TS (Ranges minus the good stuff, like views or actions)
- ▶ “Based on Concepts TS which was finalised, what, 2–3 years ago?” Hah!
- ▶ Latest draft: <http://wg21.link/N4651>
- ▶ C++11 implementation: <https://github.com/ericniebler/range-v3>
- ▶ Concepts-based implementation:
<https://github.com/CaseyCarter/cmcstl2>
- ▶ This is the beginning of STLv2 (namespace std2)
- ▶ Eric shows snippets of code that use the standard library and then converts them to use ranges — so nice!
- ▶ “Projection” is basically a map using a unary function
- ▶ SentinelsHow to convert your own algorithms to using Ranges TS
- ▶ Ranges and coroutines:
<https://github.com/toby-allsopp/ranges-coroutines> — lets you write lazy ranges which work very well with views

History of Time: Asynchronous C++ - Steven Simpson [ACCU 2017]

Video

- ▶ how not to implement network server
- ▶ don't use one thread per connection
- ▶ epoll (IO completion ports): OS tells us when a connection is ready, so we don't need threads, don't have race conditions, and can scale well
- ▶ overview of callback libraries, including Boost ASIO
- ▶ live reimplement of ASIO event loop
- ▶ “futures” in event loops: no threads, but syntactic sugar around callbacks: like JavaScript promise or Python deferred
- ▶ coroutines (“user-space threads”)
- ▶ fibers are the same as stackful coroutines
- ▶ his “coroutine” code is using Boost coroutines, not Coroutines TS
- ▶ demonstrates performance degradation and scaling capabilities of all the way of implementing async code
- ▶ slide 116 has a summary table at 1:26:30

C++11 Multithreading done right? - Rainer Grimm @ Meeting C++ 2014

Video

- ▶ discusses snippets of code, best practices, what not to do
- ▶ engages the audience (a bit too much IMHO) [?] lots of interruptions, sometimes they see his bugs and it all gets very confusing
- ▶ poor volunteer with the microphone running around like mad trying his best to catch random replies across the huge room

Why does C++ seem to be mentioned a lot in jobs related to video encoding or streaming?

Reddit

- ▶ C++ is efficient, close to metal, you can do anything, and tooling is readily available
- ▶ Soft real-time constraints, speed is king
- ▶ Memory constraints for embedded encoders/decoders
- ▶ C++ toolchain permits optimisations that are simply not possible in other languages
- ▶ SIMD

Using C++ Resumable Functions with Libuv

GitHub :: [Blog post](#)

- ▶ “Libuv is a C library that provides the asynchronous I/O in Node.js. While it was explicitly designed for use by Node.js, it can be used on its own and provides a common cross-platform API, abstracting away the various platform-specific asynchronous APIs.”
- ▶ “With resumable functions, you can write code that looks very sequential but executes asynchronously.”
- ▶ Header-only wrappers for the main lib functions

Using C++ Coroutines with Boost C++ Libraries

Blog post

- ▶ Using coroutines with `boost::future` and `boost::asio`
- ▶ Interesting techniques for adapting future/promise and callback-based APIs to using coroutines
- ▶ I expect more adaptations like this coming in the near future
 - ▶ [awaitable_tasks](#) — for `boost::asio`
 - ▶ [a Gist by John Bandela](#) — a much simpler version that relies on `boost::asio` capability to return a future instead of using a callback.

PDF

- ▶ Current status (as of 30 Nov 2016)
- ▶ Overview and motivation
- ▶ Stackful vs. stackless
- ▶ Coroutines as generators
- ▶ Coroutines instead of callbacks
- ▶ Awaitable types vs. coroutine return types
- ▶ Gotchas
