# C++ Club Meeting 100

Gleb Dolgich

2020-02-27

#### **Prague Trip Reports**

- Bryce Lelbach et al.
  - 252 attendees! 23 subgroups! 9 tracks!
  - C++20 is done!
  - C++23 roadmap! Standard library modules; library support for coroutines; executors; networking. Also: reflection; pattern matching; contracts.
- Herb Sutter
  - Reddit.
- CppCast with Hana Dusíková

### C++20 is here

- Video
- Reddit

# Bjarne Stroustrup on C++20's significance

- ISO C++
  - Reddit

#### Quote:

- 30 years of C++ standardization.
- 40 years of C++.
- C++20 is the 6th standard, the 3rd major standard; by "major" I
  mean "changes the way people think."
- This is something like the 75th meeting; I have been at about 70 of those.

#### Excited about C++20

#### Reddit

#### Comment:

I work in a large codebase that was originally written in C and was compiled with C++03 just a few years ago. Since then, we have upgraded through C++11, C++14 and are now using C++17. So far, my experience is that every upgrade has been almost exclusively a positive experience, and each version has made it easier to write safe and expressive code.

### Concepts pushed to Clang master

### #clang #concepts #trunk.

```
O3:09:53 projects > llvm-project clang git push trunk master
Enumerating objects: 48, done.
Counting objects: 100% (48/48), done.
Delta compression using up to 8 threads
Compressing objects: 100% (24/24), done.
Writing objects: 100% (25/25), 4.10 KiB | 2.05 MiB/s, done.
Total 25 (delta 23), reused 1 (delta 1)
remote: Resolving deltas: 100% (23/23), completed with 23 local objects

## [C++ coroutines] Initial implementation pushed to GCC master

- Message
- Reddit

This is not enabled by default (even for -std=c++2a), it needs -fcoroutines

### How to keep up with C++ news

# CppCast Ep. 233: Large Scale C++ with John Lakos

- Audio
- Video

There's a misunderstanding (of contracts in the C++ committee – GD) that's not easy to appreciate if you're not a real day-to-day software engineer. That is what derailed contracts. I will fix it. I promise you, I will fix it.

### Follow-up: Aggregates

#### From CppReference: An aggregate is one of the following types:

- · array type
- class type (typically, struct or union), that has
  - no private or protected direct (since C++17) non-static data members
  - no user-declared constructors (until C++11)
  - no user-provided constructors (explicitly defaulted or deleted constructors are allowed) (since C++11) (until C++17)
  - no user-provided, inherited, or explicit constructors (explicitly defaulted or deleted constructors are allowed) (since C++17) (until C++20)
  - no user-declared or inherited constructors (since C++20)
  - no virtual, private, or protected (since C++17) base classes
  - · no virtual member functions
  - no default member initializers (since C++11) (until C++14)

## "Making new friends" idiom by Dan Saks

#### Wikibooks

The goal is to simplify creation of friend functions for a class template.

```
1 template<typename T>
   class Foo {
      T value;
   public:
      Foo(const T& t) { value = t; }
 5
 6
      friend ostream& operator <<(ostream& os, const Foo<T>& b)
 8
         return os << b.value;</pre>
 9
10 };
```

### A new decade, a new tool: libman

### A hidden gem: inner\_product (2/2)

This makes me so incredibly happy! I literally just yesterday googled, C+++17 / C++20 zip to see if they had anything, because I wrote some code in both C++ and #Python and Python was so much more beautiful.

# Twitter: Pure virtual function syntax (1/2)

# Shafik Yaghmour @shafikyaghmour Rereading "The Design and Evolution of C++"

= 0

syntax was used for pure virtual function in order to avoid having to add a new keyword such as pure or abstract because the feature was added close to the next release.

# Twitter: Pure virtual function syntax (2/2)

#### 13.2.3 Syntax

The curious =0 syntax was chosen over the obvious alternative of introducing a keyword pure or abstract because at the time I saw no chance of getting a new keyword accepted. Had I suggested pure, Release 2.0 would have shipped without abstract classes. Given a choice between a nicer syntax and abstract classes, I chose abstract classes. Rather than risking delay and incurring the certain fights over pure, I used the traditional C and C++ convention of using 0 to represent "not there." The =0 syntax fits with my view that a function body is the initializer for a function and also with the (simplistic, but usually adequate) view of the set of virtual functions being implemented as a vector of function pointers (§3.5.1). In fact, =0 is not best implemented by putting a 0 in the vtbl. My implementation places a pointer to a function called \_\_pure\_virtual\_called in the vtbl; this function can then be defined to give a reasonable run-time error.

I chose a mechanism for specifying individual functions pure rather than a way of declaring a complete class abstract because the pure virtual function notion is more flexible. I value the ability to define a class in stages; that is, I find it useful to define some virtual functions and leave the definition of the rest to further derived classes.

# Move, simply

#### Herb Sutter

HackerNews

The state of  $\alpha$  after it has been moved from is the same as the state of  $\alpha$  after any other non-const operation. Move is just another non-constfunction that might (or might not) change the value of the source object.

· Move, even more simply by Corentin Jabot

In the absence of other information, do not do anything to an object on which std::move has been called, except assignment operator and destructor.
